

Arizona Hantavirus Update

David M. Engelthaler
State Epidemiologist

Peromyscus Maniculatus
Reservoir for Sin Nombre Virus

Rodent-borne Viruses of Arizona

- Hantaviruses:
 - Sin Nombre
 - Limestone Canyon
 - El Moro Canyon
- Arenaviruses:
 - Lymphocytic Choriomeningitis Virus
 - Whitewater Arroyo Virus

Characteristics of Hantaviruses

- Rodent hosts
Genus and possibly species specific
- Transmission:
 - Biting, communal behavior
 - Aerosolization of virus from rodent excreta
 - Some human-to-human (Andes Virus only)
- Primarily Old World Disease until 1993 Four-Corners outbreak

Rodent Associations with Hantavirus

- Solely rodent reservoirs (except for one insectivore)
- Typically 1 virus → to one host
- Chronic asymptomatic infections
- Long-term shedding of virus
- Present in 3 subfamilies of murid rodents

Virus is Rodent-specific

Virus Strain

Rodent Host

Hantaan ↔ *Apodemus agrarius*

Dobrava ↔ *Apodemus flavicollis*

Seoul ↔ *Rattus norvegicus*

Thailand ↔ *Bandicota indicus*

Murinae

Prospect Hill ↔ *Microtus pennsylvanicus*

Puumala ↔ *Clethrionomys glareolus*

Arvicolinae

Sin Nombre ↔ *Peromyscus maniculatus*

New York ↔ *Peromyscus leucopus*

Bayou ↔ *Oryzomys palustris*

Black Creek Canal ↔ *Sigmodon hispidus*

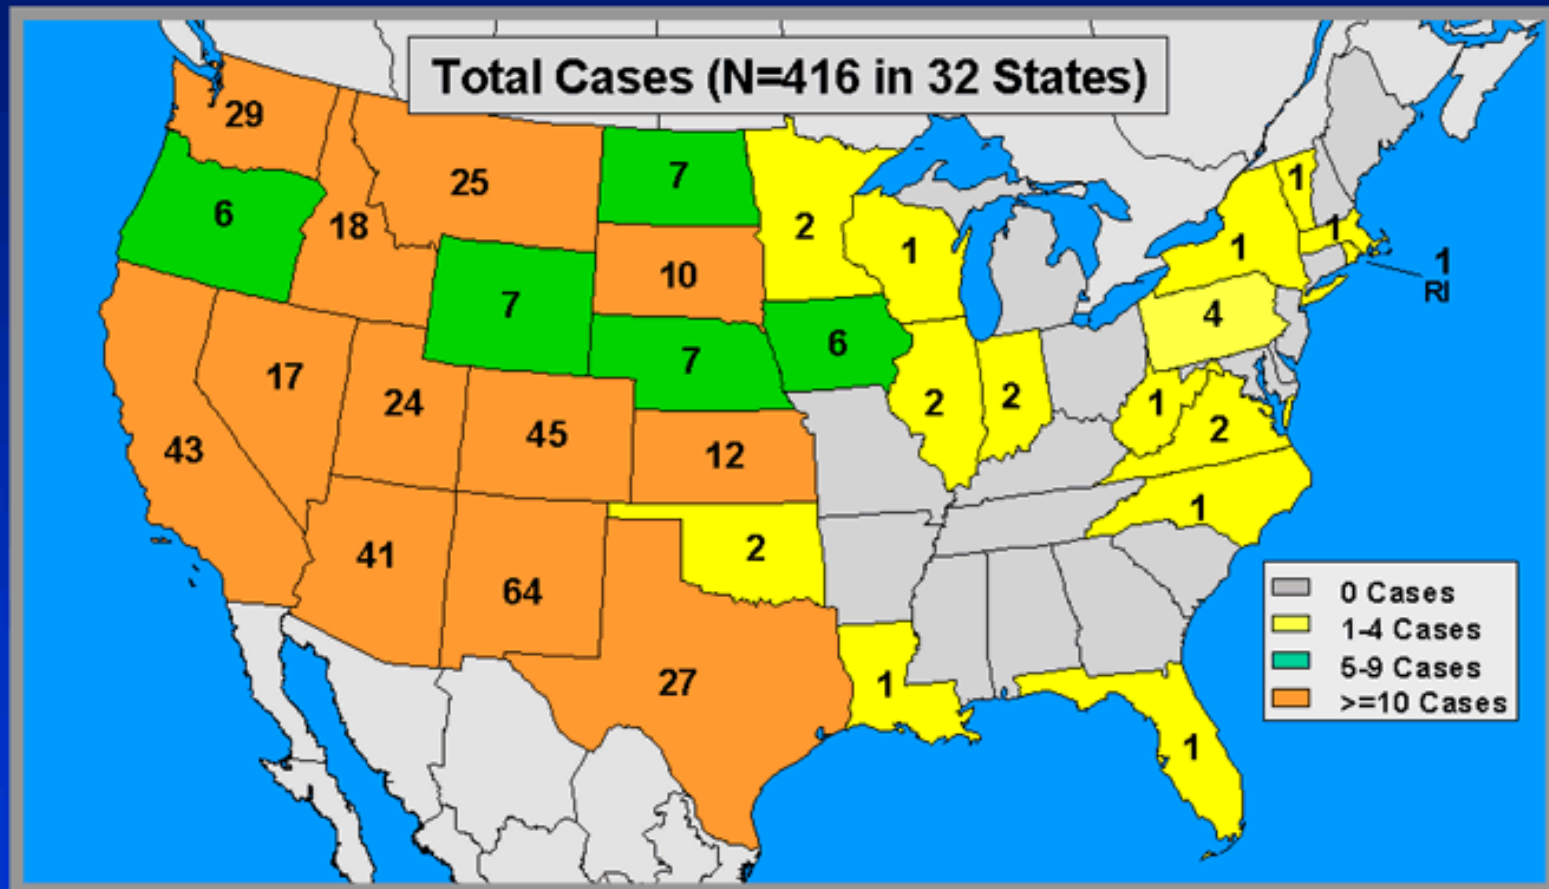

Sigmodontinae

New World Hantaviruses

Update

Hantavirus Pulmonary Syndrome Cases by State of Residence United States – February 1, 2006

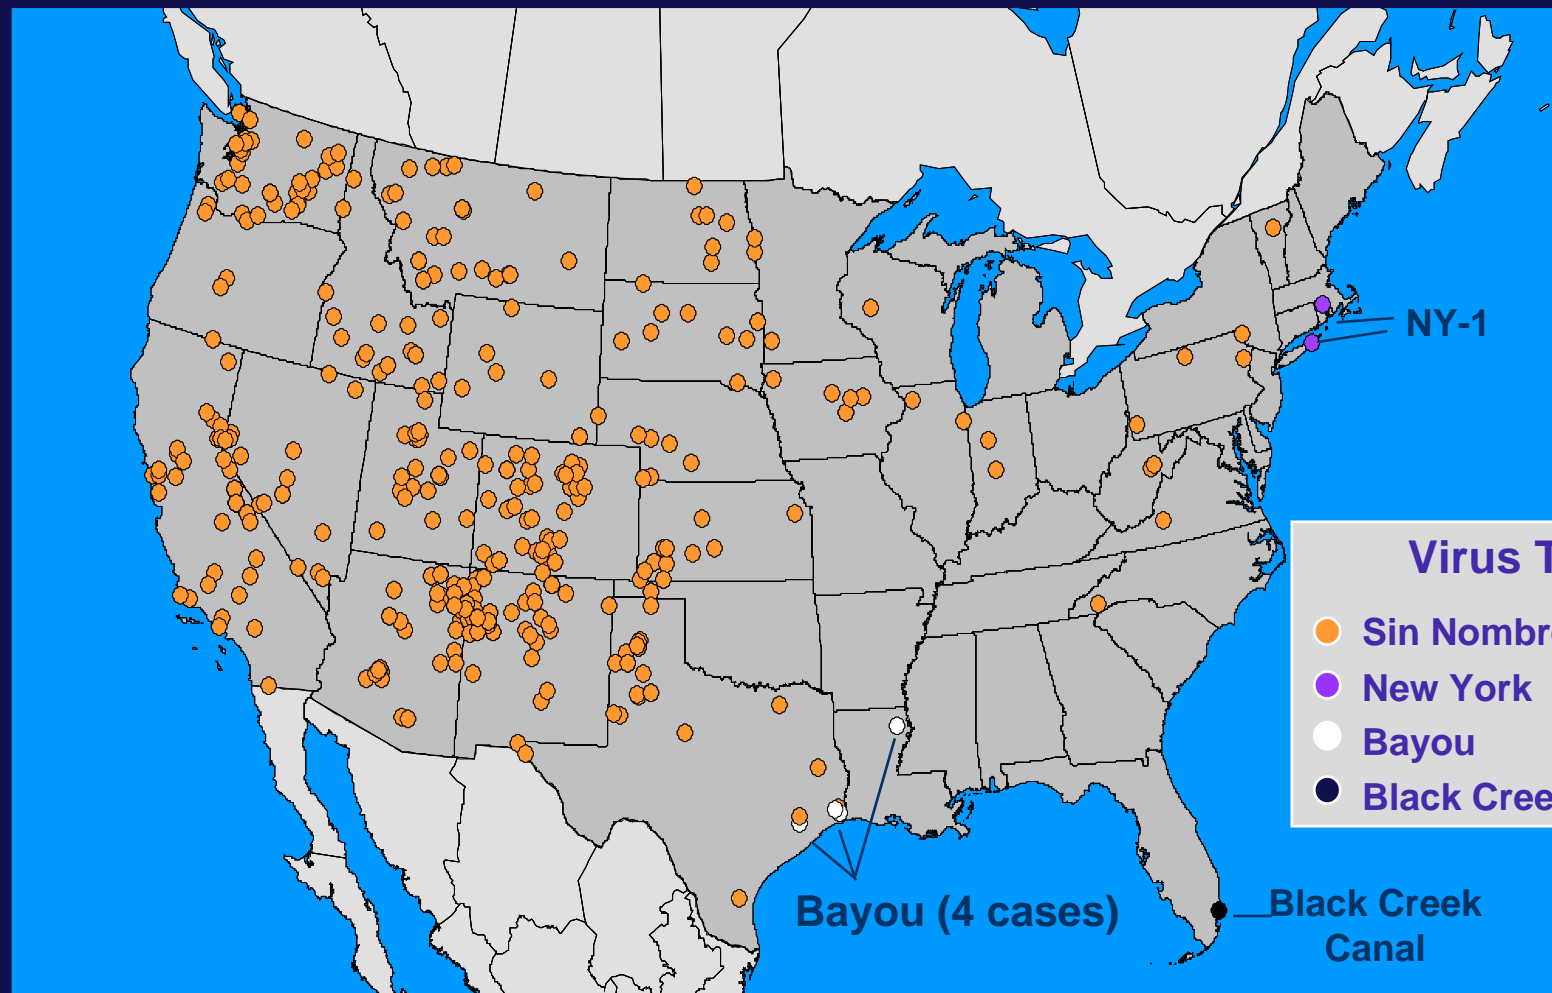

Five cases were reported with either unknown state of residence or were not residents of the United States.

CDC

Location of HPS Cases by Virus Type as of February 1, 2006

Total Cases (N = 416 in 30 States)

Hantavirus Pulmonary Syndrome, United States

Descriptive Demographic Statistics, February 1, 2006

Characteristics	Total	AZ
N	416 (100%)	47 (11%)
Gender		
Male	260 (63%)	25 (53%)
Female	156 (37%)	22 (47%)
Race		
White	320 (77%)	19 (40%)
American Indian	79 (19%)	26 (55%)
Black	6 (2%)	--
Asian	3 (1%)	--
Ethnicity		
Hispanic	55 (13%)	2 (4%)
Case Fatality		
Dead	146 (35%)	15 (32%)
Age (years)	Mean = 38 [10 – 83]	Mean = 39 [11 – 71]

Arizona HPS Cases, 1992-2006

Why?

The Hantavirus Infection Cycle

Environmental and Climatic Factors Associated with Cases

- Strong seasonality
- Different biomes have different seasonality
- Infection rates fluctuate with climate and population size
- Outbreaks tied to heavy rainfall and subsequent drought

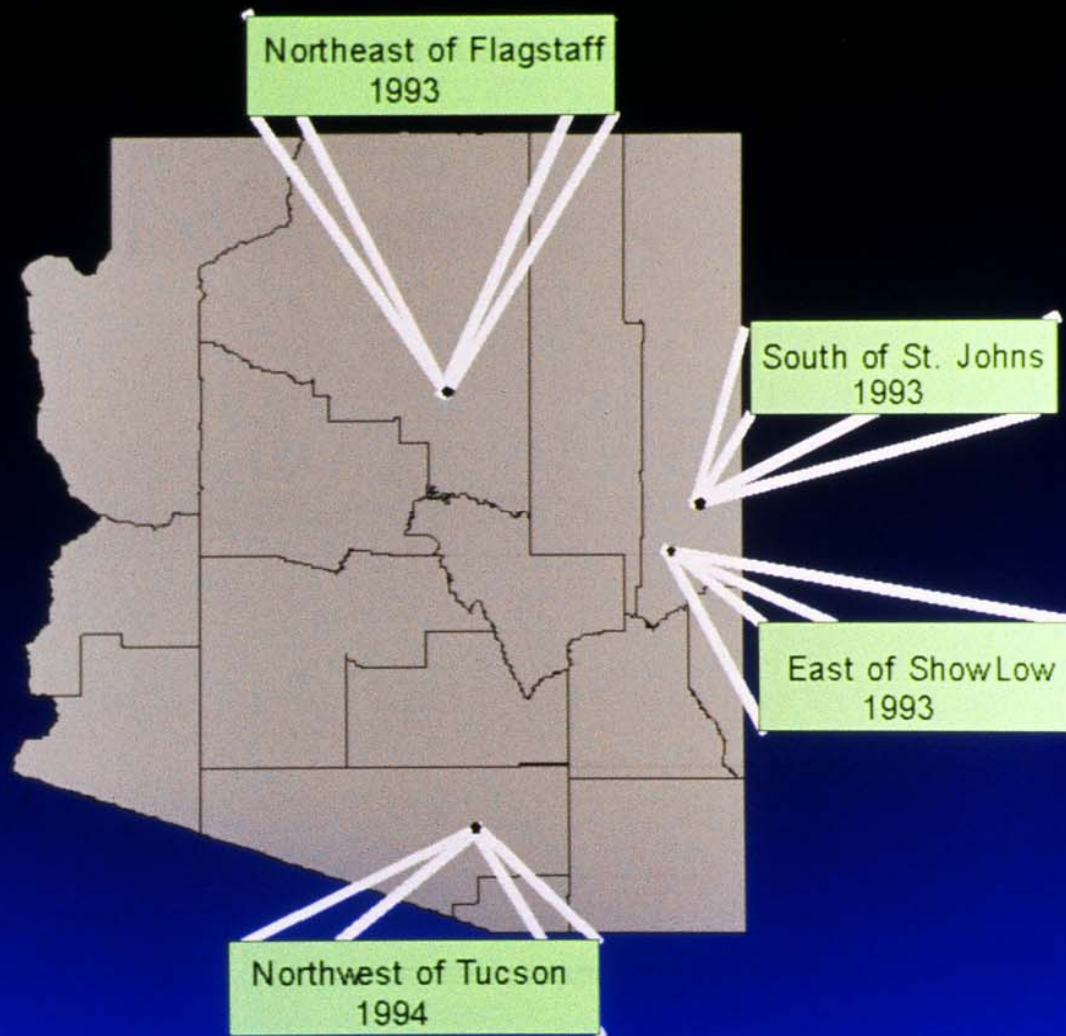

Idealized Profile of Biomes Sampled Southwestern United States

DECREASE IN SEROPREVALENCE OF ANTIBODIES TO HANTAVIRUS IN RODENTS FROM 1993– 1994 HANTAVIRUS PULMONARY SYNDROME CASE SITES

Engelthaler, Levy, Fink, et al,
1998, Am J Trop Med Hyg

1993-1997 Arizona Hantavirus Retrap Study Sites

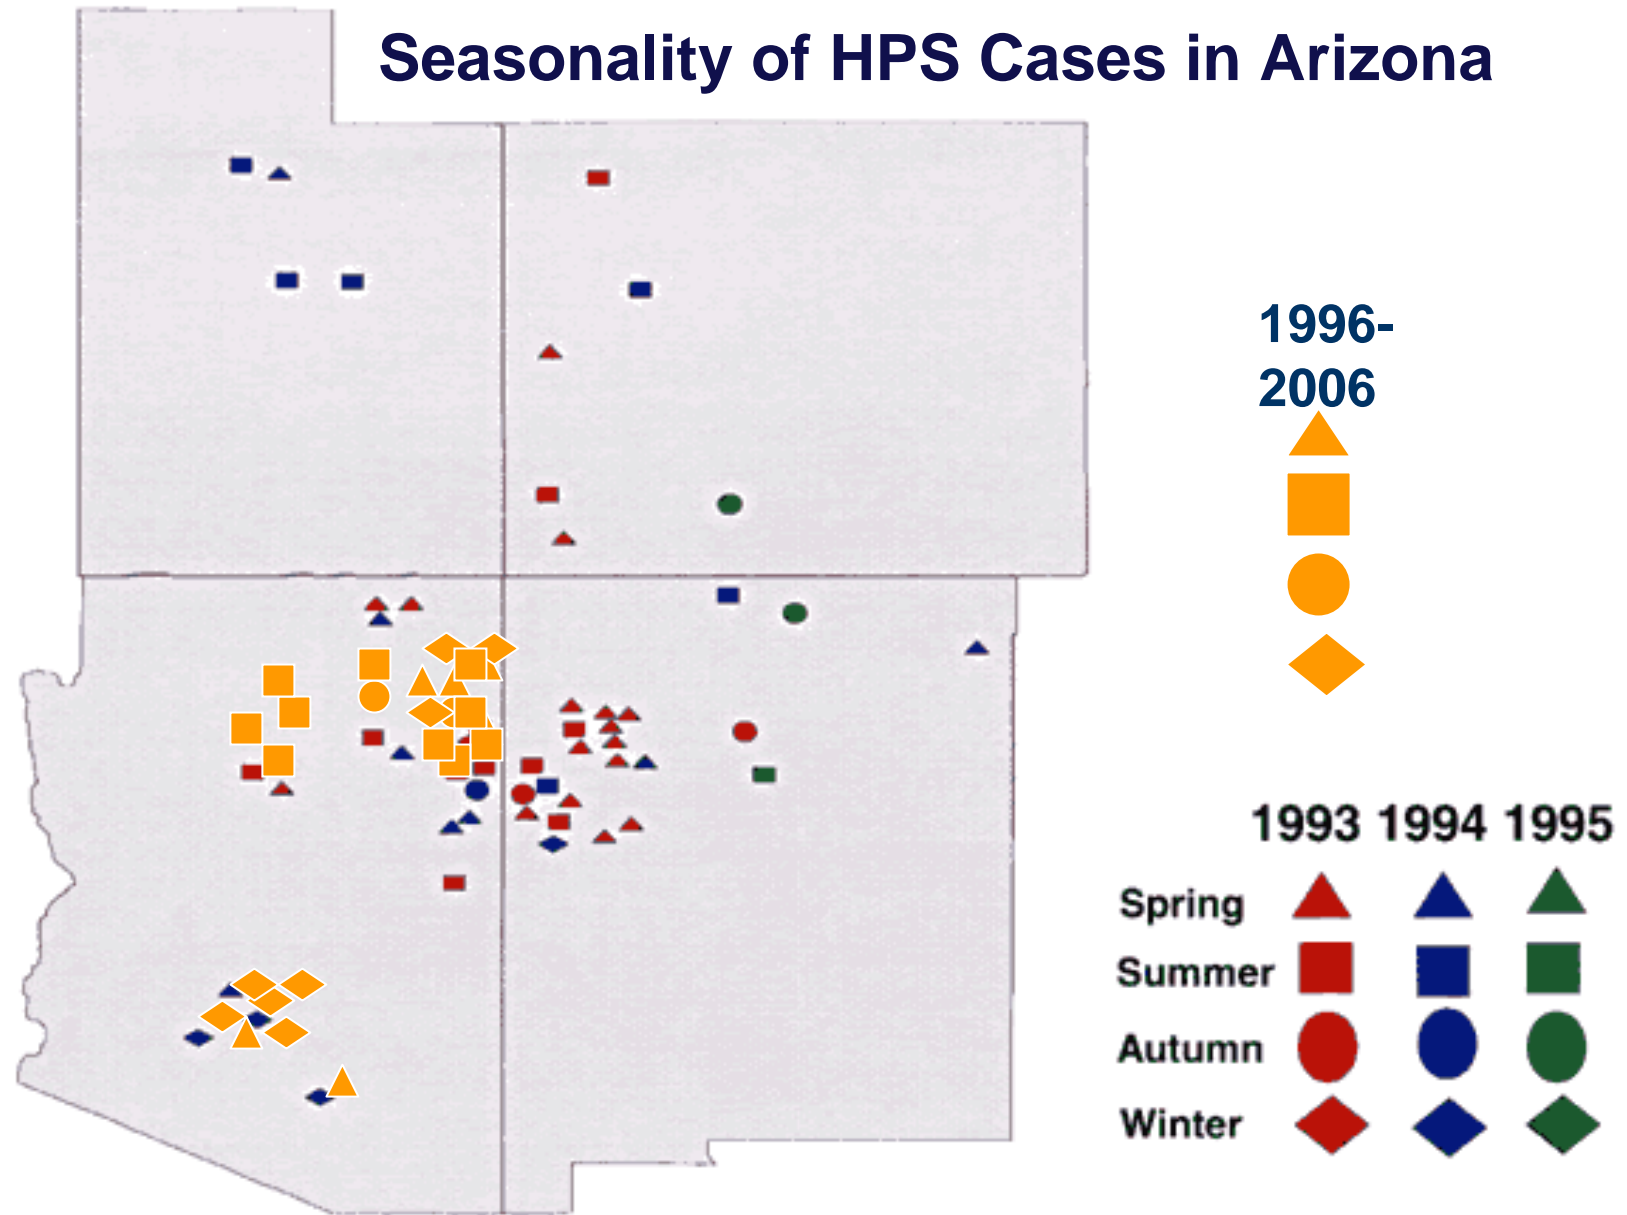

- Study identified “...a significant decrease in *Peromyscus* hantavirus antibody seroprevalence from the 1993–1994 outbreak trapping period to the 1996–1997 retrapping period ($X^2 = 43.59$, $P < 0.0001$)”

Climatic and environmental patterns associated with hantavirus pulmonary syndrome, Four Corners region, United States

Engelthaler, Mosely, et al,
1999, Emerg Infect Dis

Seasonality of HPS Cases in Arizona

The Influence of Climate

HPS cases in Four Corners States and Precipitation, 1992-1995

From Engelthaler, Mosley et al, 1999, EID

2005-2006 Precipitation Change from 30-yr mean Phoenix

2005-2006 Rainfall vs. 30 Year Mean

Delayed Density Dependence

↑ Rainfall → ↑ Vegetation → ↑ Rodents →
→ ↑ Infected Rodents → ↔ % infected

followed by

↓ Rainfall → ↓ Rodents → ↑ % Infected
→ ↑ Risk to Humans

Delayed Density Dependence

Mills et al, 1999, EID

Prevention and Control

Prevention and Control

- No Vaccine
- No Treatment
- Behavioral Control
 - Reduce exposure to rodents, nests and droppings
 - Clear brush and clutter away from home
 - Close entryways into home
 - Trap out existing rodents
 - Use 10% Bleach or Lysol to wet down and disinfect

Clear brush and clutter away from home

Wet Disinfection

Rodent Proofing

To keep rodents out of your home:

■ **Keep hay or wood piles** at least 100 feet from houses. When possible, elevate hay or wood at least one foot off the ground.

■ **Clean up food spills.** Don't allow dirty dishes to sit out in the open for long periods.

■ **Cover or seal all holes** in floors and walls larger than one-quarter inch.

■ **Keep food** — including pet food, bird seed, etc. — stored in rodent-proof metal or thick plastic containers with tight-fitting lids.

■ **To kill mice**, spring traps are recommended, as use of poisons may result in accidental poisoning of other animals or children.

■ **Place three inches** of gravel under the base of mobile homes to discourage rodent burrowing.

Before Control Measures

After Control Measures

Summary

- Sin Nombre virus is found throughout Arizona in deer mouse populations
- Biome and geography dictate seasonal risk of disease
- Climate and environment highly influence overall risk between years
- Prevention of disease can only occur through risk reduction behaviors

Thank You!
